

## Upgrading - A smart investment

### Upgrading - A smart investment

Interruptions in production could have devastating consequences for a business. Deliveries are delayed, raw materials can expire and become useless. When something in the control equipment breaks it's important to ensure that the broken part actually is replaceable. By time suppliers are phasing out spare parts and support for old control systems whose life cycle has expired.

It is then a smart investment to have ensured the production and lifetime of the plant through a preventative upgrade.

We offer system upgrades including conversion of software for HMI and PLC, electrical and system documentation etc.
